

## All on Four technique

This technique provides a «new» set of teeth by using just four implants to which the entire prosthesis is attached. It is the optimal solution for those who have lost a significant number of teeth. This technique is much more «natural» than a removable prosthesis, because it enables the patient to adapt to it more rapidly.

## All on Six technique

Unlike the previous technique, this solution may compensate for the loss of all teeth with six implants to which the bridge is secured. The All-on-six technique also provides an optimal solution whenever teeth from single arches are missing, as well as allowing for rapid integration.
